Module 3: Workflows

Git Workflows

by Guille Polito
@GuillePolito

Working Alone

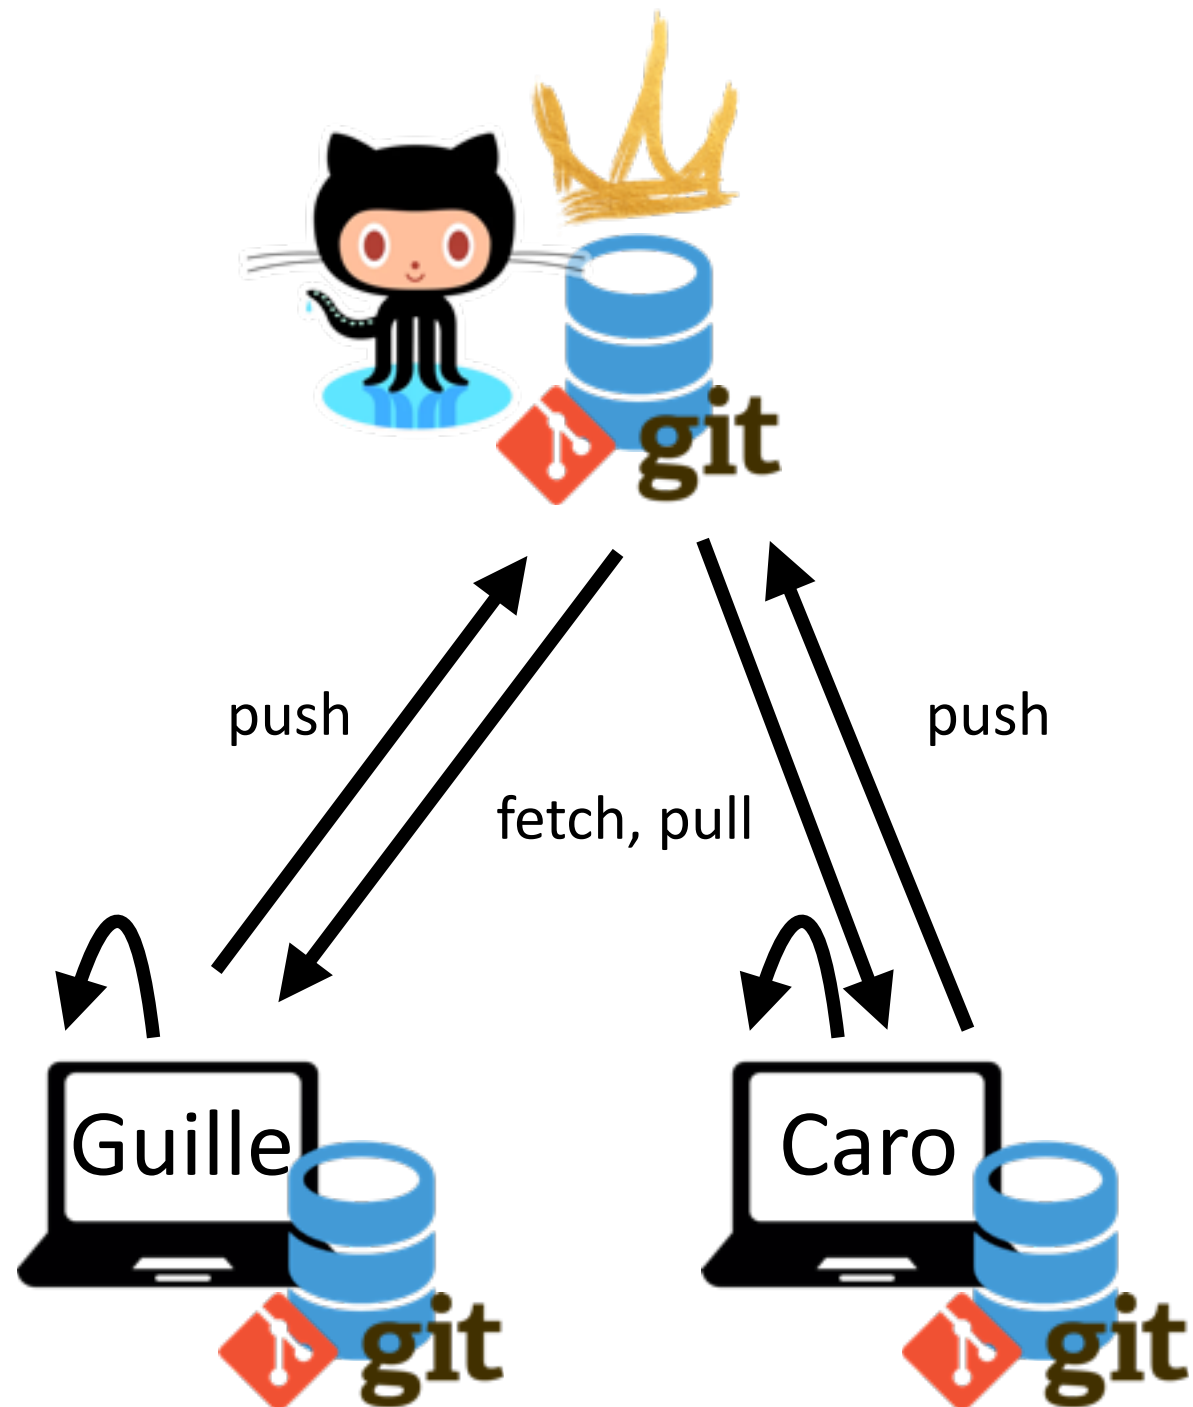

- remote repository is more like a backup
- still, people can load our code

Working Alone: How to

- Just clone your repository

Collaboration: single repo

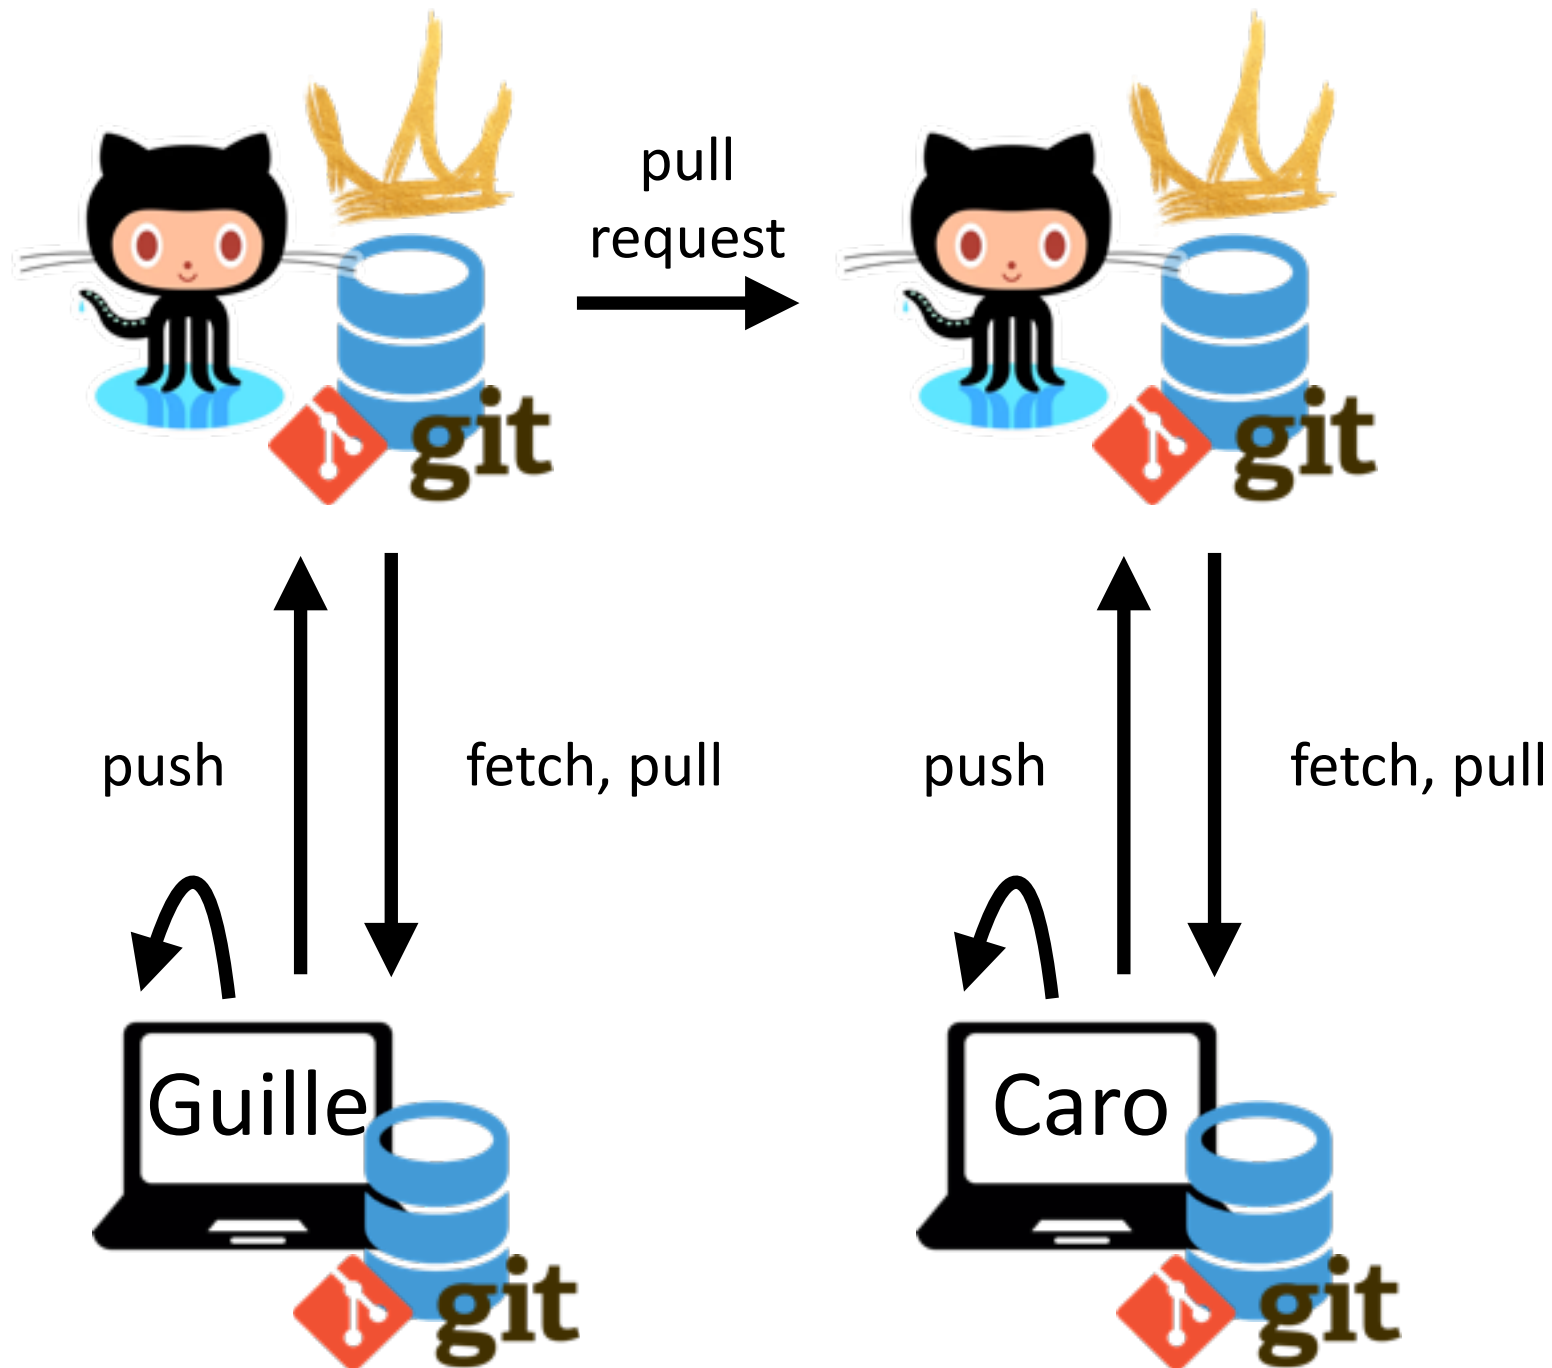

- everybody has the same privileges

Single repo: How to

- Both users clone the same repository
- Both users are set as collaborators of the repository

Collaboration: pull request

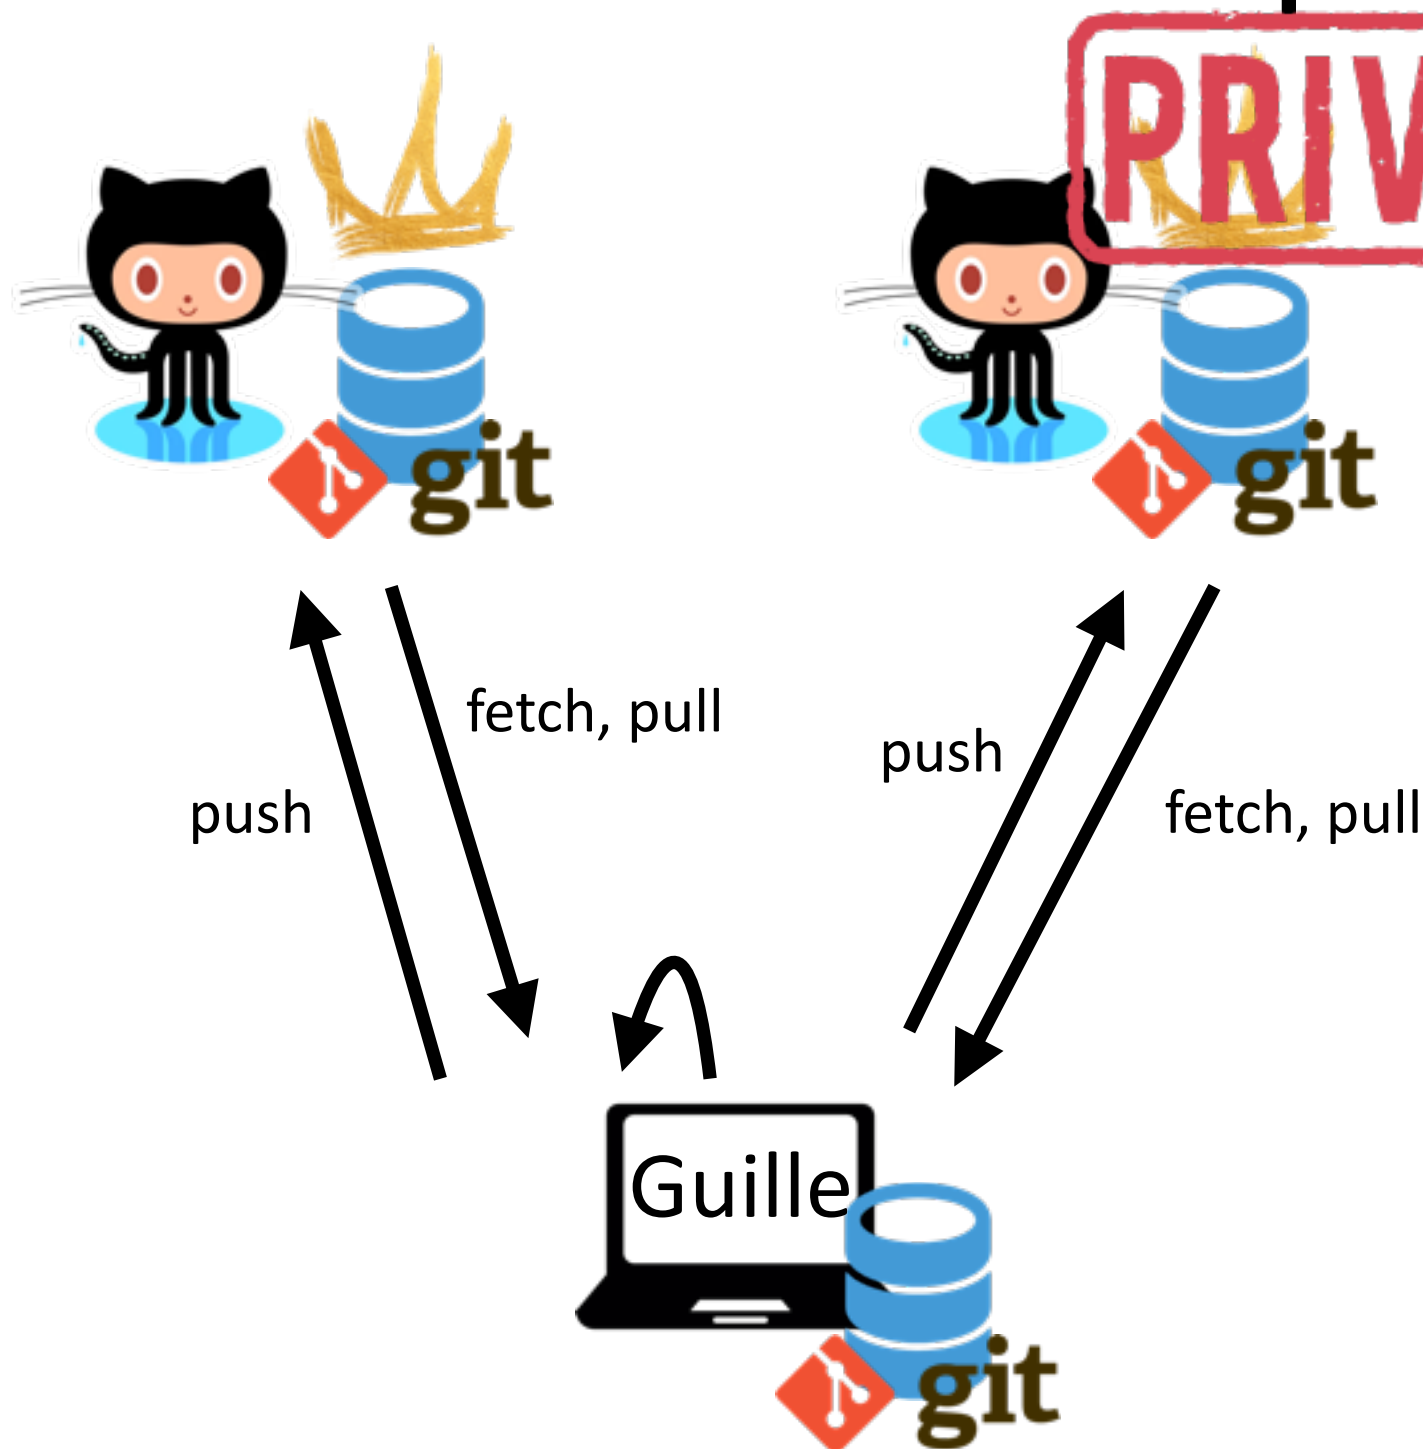

- Each one on his one remote
- Guille has less privileges than Caro

Pull Requests: How to

- First Github Fork (copy repository)
- Work as in “Working alone”
- Then Pull request from GitHub
(merge request in other techs)

Manage visibility with multiple remotes

- Develop in private
- Push selected branches/tags to public repository

Multiple repositories: How to

- Work as in “Working Alone”
- Add a separate remote
- Pull push selecting a remote

Remotes

- `$ git remote -v`
- `$ git remote add someName https://someURL`
- `$ git fetch someName`
- `$ git pull someName branch`
- `$ git push someName`
